

Healthcare Dashboard

1.Introduction

The objective of Week 6 was to create an interactive Healthcare Dashboard using the cleaned healthcare dataset and the data model prepared in Week 5.

2. Data model and Measure Table

3. Total patients

calculates the total number of patient records.

4. Total Billing Amount

calculates the total billing amount.

5. Average Billing Amount

calculates the average billing amount.

6. Average Length of Stay

calculates the average number of days between admission and discharge.

7. Readmission Rate

calculates the rate of patients having more than one admission.

The screenshot displays a data modeling tool interface. On the left, a table named 'Patient' is visible with columns 'Group', 'Type', and 'r'. A measure named 'Readmission Rate' is selected from the 'measure table healthcare' list. The DAX formula for this measure is shown in the bottom pane:

```
1 Readmission Rate =  
2 VAR TotalCount = [Total Patients]  
3  
4 VAR RepeatPatients =  
5     COUNTROWS(  
6         FILTER(  
7             SUMMARIZE(  
8                 Billing,  
9                 Billing[Dim_Patient.patient ID],  
10                "AdmissionCount", COUNTROWS(Billing)  
11            ),  
12            [AdmissionCount] > 1  
13        )  
14    )  
15  
16 RETURN  
17     DIVIDE(RepeatPatients, TotalCount, 0)
```

8. Final healthcare dashboard

The final Healthcare Dashboard was created in Power BI using KPI cards, a matrix, charts, and slicers. It provides an interactive view of patient details, billing information, medical conditions, admission types, and insurance providers. The dashboard contains four KPI cards, a matrix, a donut chart, a stacked bar chart, a line and stacked column chart, a clustered column chart, and three slicers for interactive filtering.
